 $\Omega \subset \mathbb{C}^n$, $w \in \Omega$

$$\mathcal{K}_{\Omega}(w) = \sup\{|f(w)|^2 : f \in \mathcal{O}(\Omega), \ \int_{\Omega} |f|^2 d\lambda \leq 1\}$$

(Bergman kernel on the diagonal)

$$G_w(z) = G_{\Omega}(z, w)$$

= sup{ $u(z) : u \in PSH^-(\Omega) : \lim_{z \to w} (u(z) - \log |z - w|) < \infty$ }

(pluricomplex Green function)

Theorem 0 Assume Ω is pseudoconvex in \mathbb{C}^n . Then for $w \in \Omega$ and $t \leq 0$

$$K_{\Omega}(w) \geq rac{1}{e^{-2nt}\lambda(\{G_w < t\})}.$$

Optimal constant: "=" if $\Omega = B(w, r)$.

Proof 1 Using Donnelly-Fefferman's estimate for $\bar{\partial}$ one can prove

$$K_{\Omega}(w) \geq \frac{1}{c(n,t)\lambda(\{G_w < t\})},\tag{1}$$

where

$$c(n,t) = \left(1 + \frac{C}{Ei(-nt)}\right)^2, \quad Ei(a) = \int_a^\infty \frac{ds}{se^s}$$

(B. 2005). Now use the tensor power trick: $\widetilde{\Omega} = \Omega \times \cdots \times \Omega \subset \mathbb{C}^{nm}$, $\widetilde{w} = (w, \ldots, w)$ for $m \gg 0$. Then

$$\mathcal{K}_{\widetilde{\Omega}}(\widetilde{w}) = (\mathcal{K}_{\Omega}(w))^m, \quad \lambda(\{G_{\widetilde{w}} < t\}) = (\lambda(\{G_w < t\}))^m,$$

and by (1) for $\hat{\Omega}$

$$K_{\Omega}(w) \geq rac{1}{c(nm,t)^{1/m}\lambda(\{G_w < t\})}.$$

But $\lim_{m\to\infty} c(nm,t)^{1/m} = e^{-2nt}$.

Proof 2 (Lempert) By Berndtsson's result on log-(pluri)subharmonicity of the Bergman kernel for sections of a pseudoconvex domain it follows that log $K_{\{G_w \le t\}}(w)$ is convex for $t \in (-\infty, 0]$. Therefore

$$t \mapsto 2nt + \log K_{\{G_w < t\}}(w)$$

is convex and bounded, hence non-decreasing. It follows that

$$K_{\Omega}(w) \geq e^{2nt}K_{\{G_w < t\}}(w) \geq rac{e^{2nt}}{\lambda(\{G_w < t\})}.$$

Berndtsson-Lempert: This method can be improved to show the Ohsawa-Takegoshi extension theorem with optimal constant.

Theorem 0 Assume Ω is pseudoconvex in \mathbb{C}^n . Then for $w \in \Omega$ and $t \leq 0$

$$\mathcal{K}_{\Omega}(w) \geq rac{1}{e^{-2nt}\lambda(\{\mathcal{G}_w < t\})}.$$

What happens when $t \to -\infty$? For n = 1 Theorem 0 immediately gives:

Theorem (Suita conjecture) For a domain $\Omega \subset \mathbb{C}$ one has

$$K_{\Omega}(w) \ge c_{\Omega}(w)^2/\pi, \quad w \in \Omega,$$
 (2)

where $c_{\Omega}(w) = \exp\left(\lim_{z \to w} (G_{\Omega}(z, w) - \log|z - w|)\right)$ (logarithmic capacity of $\mathbb{C} \setminus \Omega$ w.r.t. w).

Theorem (Guan-Zhou) Equality holds in (2) iff $\Omega \simeq \Delta \setminus F$, where Δ is the unit disk and F a closed polar subset.

What happens with $e^{-2nt}\lambda(\{G_w < t\})$ as $t \to -\infty$ for arbitrary *n*? For convex Ω using Lempert's theory one can get

Proposition If Ω is bounded, smooth and strongly convex in \mathbb{C}^n then for $w \in \Omega$

$$\lim_{t \to -\infty} e^{-2nt} \lambda(\{G_w < t\}) = \lambda(I_{\Omega}^{\kappa}(w)),$$

where $I_{\Omega}^{K}(w) = \{\varphi'(0) : \varphi \in \mathcal{O}(\Delta, \Omega), \varphi(0) = w\}$ (Kobayashi indicatrix).

Corollary If $\Omega \subset \mathbb{C}^n$ is convex then

$$\mathcal{K}_\Omega(w) \geq rac{1}{\lambda(I_\Omega^\mathcal{K}(w))}, \quad w\in \Omega.$$

For general Ω one can prove

Theorem If Ω is bounded and hyperconvex in \mathbb{C}^n and $w \in \Omega$ then

$$\lim_{t\to -\infty} e^{-2nt} \lambda(\{G_w < t\}) = \lambda(I_{\Omega}^A(w)),$$

where $I_{\Omega}^{A}(w) = \{X \in \mathbb{C}^{n} : \overline{\lim}_{\zeta \to 0} (G_{w}(w + \zeta X) - \log |\zeta|) \leq 0\}$ (Azukawa indicatrix) Corollary (SCV version of the Suita conjecture) If $\Omega \subset \mathbb{C}^n$ is pseudoconvex and $w \in \Omega$ then

$${\it K}_{\Omega}(w)\geq rac{1}{\lambda(I^{\cal A}_{\Omega}(w))}.$$

Remark 1. For n = 1 one has $\lambda(I_{\Omega}^{A}(w)) = \pi/c_{\Omega}(w)^{2}$. 2. If Ω is convex then $I_{\Omega}^{A}(w) = I_{\Omega}^{K}(w)$.

Conjecture For Ω pseudoconvex and $w \in \Omega$ the function

$$t \longmapsto e^{-2nt} \lambda(\{G_w < t\})$$

is non-decreasing in t.

It would easily follow if we knew that the function

$$t \longmapsto \log \lambda(\{G_w < t\})$$

is convex on $(-\infty, 0]$. Fornæss however constructed a counterexample to this (already for n = 1).

Theorem The conjecture is true for n = 1. Proof It is be enough to prove that $f'(t) \ge 0$ where

$$f(t) := \log \lambda(\{G_w < t\}) - 2t$$

and t is a regular value of G_w . By the co-area formula

$$\lambda(\{G_w < t\}) = \int_{-\infty}^t \int_{\{G_w = s\}} \frac{d\sigma}{|\nabla G_w|} ds$$

and therefore

$$f'(t) = rac{\displaystyle \int_{\{G_w=t\}} rac{d\sigma}{|
abla G_w|}}{\lambda(\{G_w < t\})} - 2.$$

By the Schwarz inequality

$$\int_{\{G_w=t\}} \frac{d\sigma}{|\nabla G_w|} \geq \frac{(\sigma(\{G_w=t\}))^2}{\int_{\{G_w=t\}} |\nabla G_w| d\sigma} = \frac{(\sigma(\{G_w=t\}))^2}{2\pi}.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

The isoperimetric inequality gives

$$(\sigma(\{G_w = t\}))^2 \ge 4\pi\lambda(\{G_w < t\})$$

and we obtain $f'(t) \ge 0$.

The conjecture for arbitrary n is equivalent to the following *pluricomplex* isoperimetric inequality for smooth strongly pseudoconvex Ω

$$\int_{\partial\Omega}\frac{d\sigma}{|\nabla G_w|}\geq 2n\lambda(\Omega).$$

(日) (日) (日) (日) (日) (日) (日) (日)

The conjecture also turns out to be closely related to the problem of symmetrization of the complex Monge-Ampère equation.

What about the corresponding upper bound in the Suita conjecture? Not true in general:

Proposition Let $\Omega = \{r < |z| < 1\}$. Then

$$rac{\mathcal{K}_\Omega(\sqrt{r})}{(c_\Omega(\sqrt{r}))^2} \geq rac{-2\log r}{\pi^3}.$$

It would be interesting to find un upper bound of the Bergman kernel for domains in \mathbb{C} in terms of logarithmic capacity which would in particular imply the \Rightarrow part in the well known equivalence (due to Carleson)

$$K_{\Omega} > 0 \Leftrightarrow c_{\Omega} > 0$$

 $(c_{\Omega}^2 \leq \pi K_{\Omega}$ being a quantitative version of \Leftarrow).

The upper bound for the Bergman kernel holds for convex domains: Theorem For a convex Ω and $w \in \Omega$ set

$$F_{\Omega}(w) := \left(K_{\Omega}(w)\lambda(I_{\Omega}^{K}(w))\right)^{1/n}.$$

Then $F_{\Omega}(w) \leq 4$.

Sketch of proof Denote $I := int I_{\Omega}^{K}(w)$ and assume that w = 0. One can show that $I \subset 2\Omega$. Then

$$\mathcal{K}_{\Omega}(0)\lambda(I)\leq \mathcal{K}_{I/2}(0)\lambda(I)=rac{\lambda(I)}{\lambda(I/2)}=4^n.$$

If Ω is in addition symmetric w.r.t. w then $F_\Omega(w) \leq 16/\pi^2 = 1.621\ldots$

Remark The proof of the optimal lower bound $F_{\Omega} \ge 1$ used $\bar{\partial}$. The proof of the (probably) non-optimal upper bound $F_{\Omega} \le 4$ is much more elementary!

For convex domains

$$F_{\Omega}(w) = \left(\lambda(I_{\Omega}(w))K_{\Omega}(w))\right)^{1/n}$$

< ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

is a biholomorphically invariant function satisfying $1 \leq F_\Omega \leq 4.$

- Find an example with $F_{\Omega} \neq 1$.
- What are the properties of the function $w \mapsto \lambda(I_{\Omega}(w))$?
- What is the optimal upper bound for F_{Ω} ?

Formulas for some convex complex ellipsoids in \mathbb{C}^2

$$\mathcal{E}(p,q) = \{ z \in \mathbb{C}^2 \colon |z_1|^{2p} + |z_2|^{2q} < 1 \}, \quad p,q \geq 1/2.$$

Blank-Fan-Klein-Krantz-Ma-Pang (1992) found implicit formulas for the Kobayashi function of $\mathcal{E}(m, 1)$. They can be made explicit for m = 1/2. Using this one can prove

Theorem For $\Omega = \{|z_1|+|z_2|^2 < 1\}$ and $b \in [0,1)$ one has

$$\lambda(I_{\Omega}((b,0))) = \frac{\pi^2}{3}(1-b)^3(1+3b+3b^2-b^3)$$

and

$$\lambda(I_\Omega((b,0))) oldsymbol{K}_\Omega((b,0)) = 1 + rac{(1-b)^3 b^2}{3(1+b)^3}.$$

 $F_\Omega((b,0))$ for $\Omega=\{|z_1|+|z_2|^2<1\}$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへぐ

Although the Kobayashi function of $\mathcal{E}(m, 1)$ is given by implicit formulas, it turns out that the volume of the Kobayashi indicatrix can be computed explicitly:

Theorem For $\Omega = \{|z_1|^{2m} + |z_2|^2 < 1\}, \ m \ge 1/2, \text{ and } b \in [0,1) \text{ one has}$ $\lambda(I_{\Omega}((b,0)))$ $= \pi^2 \left[-\frac{m-1}{2m(3m-2)(3m-1)} b^{6m+2} - \frac{3(m-1)}{2m(m-2)(m+1)} b^{2m+2} + \frac{m}{2(m-2)(3m-2)} b^6 + \frac{3m}{3m-1} b^4 - \frac{4m-1}{2m} b^2 + \frac{m}{m+1} \right].$

For m = 2/3

$$\lambda(I_{\Omega}((b,0))) = \frac{\pi^2}{80} \left(-65b^6 + 40b^6 \log b + 160b^4 - 27b^{10/3} - 100b^2 + 32 \right),$$

and $m = 2$

 $\lambda(I_{\Omega}((b,0))) = \frac{\pi^2}{240} \left(-3b^{14} - 25b^6 - 120b^6 \log b + 288b^4 - 420b^2 + 160 \right).$

About the proof Main tool: Jarnicki-Pflug-Zeinstra (1993) formula for geodesics in convex complex ellipsoids. If

$$\mathbb{C} \supset U \ni z \longmapsto (f(z), g(z)) \in \partial I$$

is a parametrization of an S^1 -invariant portion of ∂I then the volume of the corresponding part of I is given by

$$\frac{\pi}{2} \int_{U} |H(z)| d\lambda(z), \tag{3}$$

< ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

where

$$H = |f|^2 (|g_{\overline{z}}|^2 - |g_z|^2) + |g|^2 (|f_{\overline{z}}|^2 - |f_z|^2) + 2\operatorname{Re} \left(f\overline{g}(\overline{f_z}g_z - \overline{f_{\overline{z}}}g_{\overline{z}}) \right).$$

Both H and the integral (3) are computed with the help of *Mathematica*. The same method is used for computations in other ellipsoids.

For $\Omega = \{|z_1|^{2m} + |z_2|^2 < 1\}$ the formula for the Bergman kernel is well known:

$$\mathcal{K}_{\Omega}(w) = rac{1}{\pi^2} (1 - |w_2|^2)^{1/m-2} rac{(1/m+1)(1 - |w_2|^2)^{1/m} + (1/m-1)|w_1|^2}{\left((1 - |w_2|^2)^{1/m} - |w_1|^2
ight)^3},$$

so that

$$\mathcal{K}_{\Omega}((b,0)) = rac{m+1+(1-m)b^2}{\pi^2 m(1-b^2)^3}.$$

Since for $t \in \mathbb{R}$ and $a \in \Delta$ the mapping

$$\Omega \ni z \longmapsto \left(e^{it}\frac{(1-|a|^2)^{1/2m}}{(1-\bar{a}z_2)^{1/m}}z_1, \frac{z_2-a}{1-\bar{a}z_2}\right)$$

is a holomorphic automorphism of Ω , $F_{\Omega}((b,0))$ for $b \in [0,1)$ attains all values of F_{Ω} in Ω .

 $F_{\Omega}((b,0))$ in $\Omega = \{|z_1|^{2m} + |z_2|^2 < 1\}$ for m = 1/2, 4, 8, 16, 32, 64, 128

$$\sup_{0 < b < 1} F_\Omega((b,0))
ightarrow 1.010182 \ldots$$
 as $m
ightarrow \infty$

・ロト・日本・モート モー うへぐ

(highest value of F_{Ω} obtained so far in arbitrary dimension)

Theorem For $\Omega = \{|z_1| + |z_2| < 1\}$ and $b \in [0, 1)$ one has

$$\lambda(I_{\Omega}((b,0))) = rac{\pi^2}{6}(1-b)^4((1-b)^4+8b)$$

and

$$\lambda(I_\Omega((b,0))) \mathcal{K}_\Omega((b,0)) = 1 + b^2 rac{(1-b)^4}{(1+b)^4}.$$

The Bergman kernel for this ellipsoid was found by Hahn-Pflug (1988):

$$\mathcal{K}_{\Omega}(w) = rac{2}{\pi^2} \cdot rac{3(1-|w|^2)^2(1+|w|^2)+4|w_1|^2|w_2|^2(5-3|w|^2)}{ig((1-|w|^2)^2-4|w_1|^2|w_2|^2ig)^3},$$

so that

$$\mathcal{K}_\Omega((b,0)) = rac{6(1+b^2)}{\pi^2(1-b^2)^4}.$$

In all examples so far the function $w \mapsto \lambda(I_{\Omega}(w))$ is analytic. Is it true in general?

(ロ)、(型)、(E)、(E)、 E) の(の)

Theorem For $\Omega = \{|z_1|+|z_2|<1\}$ and $b\in [0,1/4]$ one has

By either of the estimates $1 \le F_{\Omega} \le 4$, the function $b \mapsto F_{\Omega}((b, b))$ cannot be analytic on (0, 1/2)! Theorem For $\Omega = \{|z_1|+|z_2|<1\}$ and $b \in [0,1/4]$ one has

$$\lambda(I_{\Omega}((b,b))) = rac{\pi^2}{6} (30b^8 - 64b^7 + 80b^6 - 80b^5 + 76b^4 - 16b^3 - 8b^2 + 1).$$

For $b \in [1/4, 1/2)$

$$\begin{split} \lambda(l_{\Omega}((b, b))) &= \frac{2\pi^2 b(1-2b)^3 \left(-2b^3+3b^2-6b+4\right)}{3(1-b)^2} \\ &+ \frac{\pi \left(30b^{10}-124b^9+238b^8-176b^7-260b^6+424b^5-76b^4-144b^3+89b^2-18b+1\right)}{6(1-b)^2} \\ &\times \arccos \left(-1+\frac{4b-1}{2b^2}\right) \\ &+ \frac{\pi (1-2b) \left(-180b^7+444b^6-554b^5+754b^4-1214b^3+922b^2-305b+37\right)}{72(1-b)} \sqrt{4b-1} \\ &+ \frac{4\pi b(1-2b)^4 \left(7b^2+2b-2\right)}{3(1-b)^2} \arctan \sqrt{4b-1} \\ &+ \frac{4\pi b^2(1-2b)^4(2-b)}{(1-b)^2} \arctan \frac{1-3b}{(1-b)\sqrt{4b-1}}. \end{split}$$

By $\chi_-(b)$, resp. $\chi_+(b)$, denote $\lambda(I_{\Omega}((b, b)))$ for $b \leq 1/4$, resp. $b \geq 1/4$. Then at b = 1/4

$$\chi_{-} = \chi_{+} = \frac{15887}{196608}\pi^{2}, \quad \chi_{-}' = \chi_{+}' = -\frac{3521}{6144}\pi^{2},$$
$$\chi_{-}'' = \chi_{+}'' = -\frac{215}{1536}\pi^{2}, \quad \chi_{-}^{(3)} = \chi_{+}^{(3)} = \frac{1785}{64}\pi^{2},$$

but

$$\chi_{-}^{(4)} = rac{1549}{16}\pi^2, \qquad \chi_{+}^{(4)} = \infty.$$

Corollary For $\Omega = \{|z_1| + |z_2| < 1\}$ the function $w \mapsto \lambda(I_{\Omega}(w))$ is not $C^{3,1}$ at w = (1/4, 1/4).

Mahler Conjecture

K - convex symmetric body in \mathbb{R}^n

$$\mathcal{K}' := \{ y \in \mathbb{R}^n : x \cdot y \le 1 \text{ for every } x \in \mathcal{K} \}$$

Mahler volume := $\lambda(K)\lambda(K')$

Mahler volume is an invariant of the Banach space defined by K: it is independent of linear transformations and of the choice of inner product. Blaschke-Santaló Inequality (1949) Mahler volume is maximized by balls Mahler Conjecture (1938) Mahler volume is minimized by cubes True for n = 2:

Hansen-Lima bodies: starting from an interval they are produced by taking products of lower dimensional HL bodies and their duals.

Equivalent SCV formulation (Nazarov, 2012)

For $u \in L^2(K')$ we have

$$|\widehat{u}(0)|^{2} = \left| \int_{\mathcal{K}'} u \, d\lambda \right|^{2} \le \lambda(\mathcal{K}') ||u||^{2}_{L^{2}(\mathcal{K}')} = (2\pi)^{-n} \lambda(\mathcal{K}') ||\widehat{u}||^{2}_{L^{2}(\mathbb{R}^{n})}$$

with equality for $u = \chi_{K'}$. Therefore

$$\lambda(K') = (2\pi)^n \sup_{f \in \mathcal{P}} \frac{|f(0)|^2}{||f||_{L^2(\mathbb{R}^n)}^2},$$

where $\mathcal{P} = \{ \widehat{u} : u \in L^2(K') \} \subset \mathcal{O}(\mathbb{C}^n)$. By the Paley-Wiener thm $\mathcal{P} = \{ f \in \mathcal{O}(\mathbb{C}^n) : |f(z)| \le Ce^{C|z|}, |f(iy)| \le Ce^{q_K(y)} \},$

where q_K is the Minkowski function for K. Therefore the Mahler conjecture is equivalent to finding $f \in \mathcal{P}$ with f(0) = 1 and

$$\int_{\mathbb{R}^n} |f(x)|^2 d\lambda(x) \leq n! \left(\frac{\pi}{2}\right)^n \lambda(K).$$

Bourgain-Milman Inequality

Bourgain-Milman (1987) There exists c > 0 such that

$$\lambda(K)\lambda(K') \geq c^n \frac{4^n}{n!}.$$

Mahler Conjecture: c = 1

G. Kuperberg (2006) $c = \pi/4$

Nazarov (2012) SCV proof using Hörmander's estimate ($c = (\pi/4)^3$)

Consider the tube domain $T_K := int K + i\mathbb{R}^n \subset \mathbb{C}^n$. Then

$$\left(\frac{\pi}{4}\right)^{2n} \frac{1}{(\lambda_n(K))^2} \leq K_{\mathcal{T}_K}(0) \leq \frac{n!}{\pi^n} \frac{\lambda_n(K')}{\lambda_n(K)}.$$

Therefore

$$\lambda_n(K)\lambda_n(K') \geq \left(\frac{\pi}{4}\right)^{3n} \frac{4^n}{n!}.$$

The upper bound $K_{T_{\kappa}}(0) \leq \frac{n!}{\pi^n} \frac{\lambda_n(K')}{\lambda_n(K)}$ easily follows from Rothaus' formula (1968):

$$K_{T_{\mathcal{K}}}(0) = (2\pi)^{-n} \int_{\mathbb{R}^n} \frac{d\lambda}{J_{\mathcal{K}}},$$

where

$$J_{\mathcal{K}}(y) = \int_{\mathcal{K}} e^{-2x \cdot y} d\lambda(x).$$

To show the lower bound $K_{T_{\kappa}}(0) \ge \left(\frac{\pi}{4}\right)^{2n} \frac{1}{(\lambda_n(\kappa))^2}$ we can use the estimate:

$$\mathcal{K}_{\mathcal{T}_{\mathcal{K}}}(0) \geq rac{1}{\lambda_{2n}(I_{\mathcal{T}_{\mathcal{K}}}(0))}$$

and

Proposition
$$I_{T_{K}}(0) \subset \frac{4}{\pi}(K + iK)$$

Conjecture $K_{T_{K}}(0) \geq \left(\frac{\pi}{4}\right)^{n} \frac{1}{(\lambda_{n}(K))^{2}}$

However, one can check that for $\mathcal{K}=\{|x_1|+|x_2|+|x_3|\leq 1\}$ we have

$${\mathcal K}_{{\mathcal T}_{{\mathcal K}}}(0)> \left(rac{\pi}{4}
ight)^3 rac{1}{(\lambda_3({\mathcal K}))^2}.$$

This shows that Nazarov's proof of the Bourgain-Milman inequality cannot give the Mahler conjecture directly.

Thank you!
